ABSTRACT:

    PURPOSE: To contrive automation of a stamping process, by reading
a **stamp**
pattern **image of a customer by a stamp** reader, registering the read
image into
an image file, transmitting the registered **image** to a terminal device
at the
time of issuing a passbook, and **printing the image as a stamp** pattern
on a
passbook to be newly issued, by a **printing** mechanism of the terminal
device.

    CONSTITUTION: A stamp pattern of a customer read by a stamp reader
10 is
registered into an image file 3 in a terminal controller 4, a central
processor

1 or the like together with the customer's ID number or the like. When the
central processor 1 receives a request for issuing a passbook, the processor 1
immediately incorporates a stamp pattern corresponding to the issue request
into passbook issue information. The information is transmitted from the
central processor 1 to a terminal device 5 for issuing the passbook, and is
analyzed by the terminal device 5. In addition to a normal process such as
printing of transaction data on the passbook 15, printing of the stamp pattern
through image processing is performed by a printing mechanism 7 of the terminal
device 5, and the passbook 15 is issued.
